

# Plan 02

**Description:** Plan 02 is a dead-ended seal chamber with no recirculation of flush fluid.

**Objective:** Often used with a jacketed seal chamber to control temperature in high temperature processes. Use only when adequate vapor margin is present in the seal chamber.

**Advantages:** Little to no maintenance. Process solids are not continuously introduced into seal chamber. Plan 62 with steam can provide additional heating or cooling and minimize coking on hot processes.
